

BOB BANNERMAN

RECOMMENDS REPLACING YOUR AIR FILTER

- **The engine in your car relies on clean air to run properly.**
- **Every Time you accelerate, your vehicle draws air into the engine that passes through the Engine Air Filter.**
- **The Engine Air Filter protects your engine by removing debris, dust, pollen, mold, and dirt from the air before it passes through to your engine.**

Dirty Engine Air Filters could lead to:

- **Reduced fuel efficiency**
- **Poor acceleration when you need it**
- **Reduced engine performance**

Changing your Engine Air Filter is an economical way to assist your engine in running at its optimum level.

Maintenance intervals will vary depending on model year, engine and type of use. Please review with your Service Advisor to determine your interval requirements
